# ENFOCUS SWITCH
WEBSERVICES MODULE

The Switch Web Services Module enables you to integrate Switch with a third-party application such as a web portal, allowing customers to submit files directly from the familiar environment into a Switch workflow.

The Switch Web Services Module enables Switch to act as a SOAP server. Any environment that can submit secure SOAP request using HTTPS can set up a connection with Switch to submit jobs and metadata, to follow up jobs in Checkpoints, to query status info, etc.
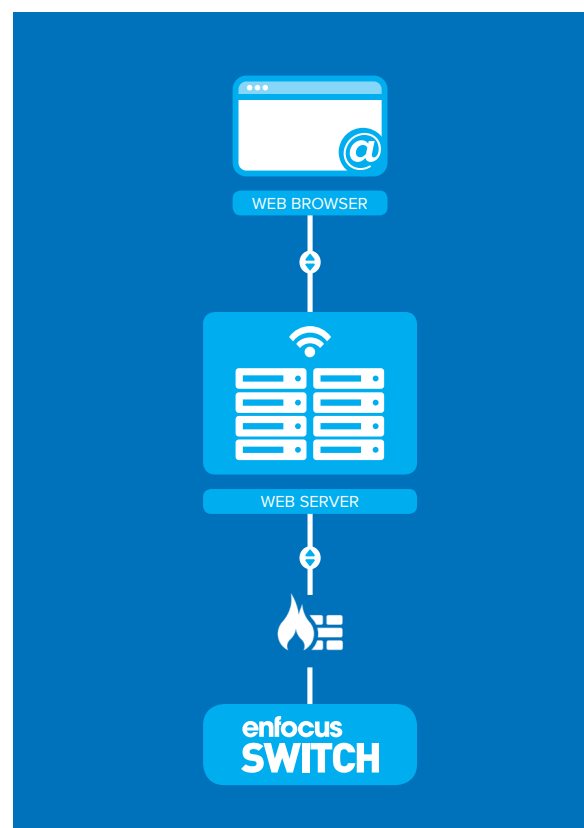

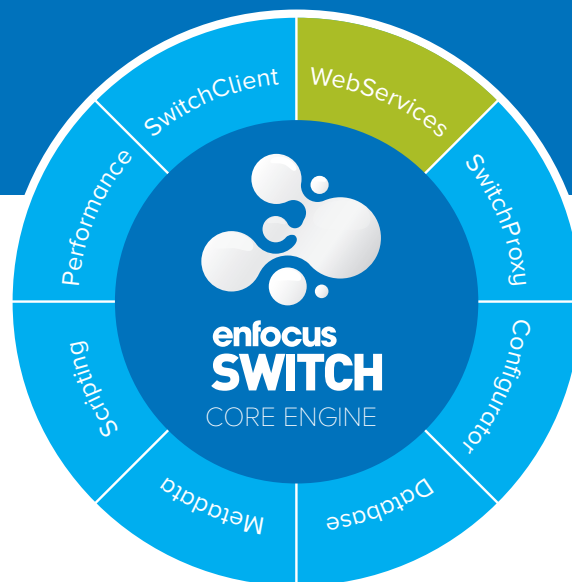

You can design custom SwitchClient interfaces within existing applications or web-based interfaces. This can be useful for external users when they need access to jobs/workflows or in cases where access to jobs needs to be built into existing application interfaces.

This module allows you to:

- **Create** your own customizable web clients to submit files or metadata for direct processing by a Switch workflow.
- **Access** a workflow globally or remotely via a web interface.
- **Track** and **approve** jobs directly in Switch without leaving the comfort zone of your company website.

The Switch Web Services Module includes an SDK (Software Development Kit) and two reference example implementations written in PHP and JavaScript. These can serve as a starting point for your own implementation.

The Switch Web Services Module also includes the SwitchClient Module (including 5 SwitchClient licenses) and allows any number of web connections to the Switch server.
